

Directions:

Work as a group to prepare a final presentation to the citizens and city council of Lancaster using information that your team has gathered during the learning experiences in this module and the questions below.

1. In the space below describe your stormwater reduction plan for Lancaster, PA.

2. Understanding that the city's population may continue to grow, does your team recommend expanding the city's gray infrastructure, adding green infrastructure, or a combination of both methods?

3. What measures can the city council and city staff take to convince the city's residents that something must be done to solve the issue of wastewater overflow, particularly during heavy or prolonged rainfall events?

4. How will your team convince the citizens that your plan is the best one, even though it may mean that taxes for homeowners and businesses will increase?

5. In your journal write a brief description of what your hometown or region is doing meet the Environmental Protection Agency's Total Maximum Daily Load (TMDL) requirements. Reflecting on what you have learned in this scenario, do you think these measures will be adequate for the present and into the future?
